HTML 5 and CSS 3, Illustrated Complete

Unit K: Incorporating Video and Audio

- Understand Web video and audio
- Use the video element
- Incorporate the source element
- Control playback

Objectives (continued)

- Add video support for older browsers
- Provide a fallback image
- Implement the audio element
- Add audio support for older browsers

Understanding Web Video and Audio

- Video and audio are widespread
 - Need to make choices on how to incorporate video and audio into Web pages
- Encoding: transforming moving image and/or sound into a digital file
 - Each encoding method known as codec
 - Main video codecs: H.264, Theora, and VP8
 - Main audio codecs: AAC, MP3, and Vorbis

Understanding Web Video and Audio (continued)

- Stream: encoded set of video or audio data
- <u>Container</u>: file that contains a video stream
 - May contain accompanying audio stream
 - > e.g., MPEG-4, Ogg, WebM, Flash Video
 - Each container commonly used with specific audio codec and specific video codec

Understanding Web Video and Audio (continued)

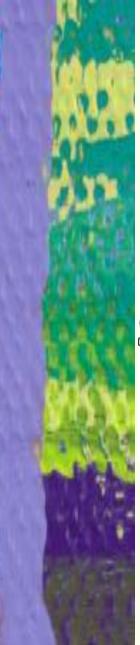

- Helper program: program that can unpack container and decode video and audio streams
 - > Also known as plugin
 - Users often need to download appropriate software packages
- Not all browsers natively support containers and codecs
 - Web developers must take steps to ensure usability when publishing media

Using the video Element

- <video> element: used to add video to a Web page
 - ➤ Only works in HTML5
 - Attributes indicate how video is presented to users of the Web page
 - src: specifies video file to display
 - width and height: dimensions of the video element within Web page
 - type: specifies container format and codecs used to encode the file
 - Container format expressed using MIME type

Using the video Element (continued)

K

HTML5 and CSS3

Code containing video element

Opening and closing video tags added

type value describes container format, video codec, and audio codec

Incorporating the source Element

- Not all browsers support all containers
- <source> element: used to specify a media file to be displayed
 - Multiple source elements can be nested within HTML5 elements
 - Can be used to reference multiple video files each specifying the same video in different container and encoding formats
 - Dimensions of the video still set in video tag attributes

Incorporating the source Element (continued)

K

HTML5 and CSS3

 Code containing multiple source elements nested within a video element

source elements added for three files in different container formats and encoded using different codecs

Controlling Playback

- Attributes of the video element provide control over how element is displayed and how user interacts with video
 - controls: instruct browser to add default controls to the video element
 - preload: when browser should download the video
 - loop: restart playback when end of video is reached
 - autoplay: start playback when page is loaded

Controlling Playback (continued)

Code for adding video controls

Adding Video Support for Older Browsers

- Older browsers do not recognize HTML5 elements
 - You can add support for older browsers while maintaining HTML5 features for browsers that support it
- To make video available, use object and param elements
 - object element defines video type / data
 - param elements define settings of the video

Adding Video Support for Older Browsers (continued)

UNIT

Controls are embedded within Flash Player video and are displayed the same way across browsers

Providing a Fallback Image

- It is likely that some potential viewers will be unable to view video content
- To preserve layout of Web page video and object element allow you to specify a fallback image
 - Gives users a taste of the content in the video
 - > For video tag, use poster attribute
 - > For object tag, create a nested img tag

Embedded •

poster attribute specifies fallback image for browsers that support the video element

Implementing the audio Element

- <audio> element: HTML5 element for linking audio files to a Web page and enabling user to control playback
 - Takes the same attributes as the video element
 - Accepts nested source elements for source files in multiple formats
- Important to display the controls because without them, audio element is invisible on the Web page

audio and

Adding Audio Support for Older Browsers

- Not all older browsers recognize the HTML5 audio tag
- Use an object element and nested param elements to specify fallback content
 - Just like you would use for fallback video
 - Even though a file contains no video, its location is indicated using the "movie" parameter

- Media files can be included in a Web page, provided that you take into consideration:
 - Encoding and container formats
 - Inclusion of helper programs and plugins
 - Providing support for older browsers
- Video is added using <video> element
 - Attributes specify how video is displayed and how user interacts with the video

Summary (continued)

- source elements allow you to provide multiple copies of the file in different formats
- Various attributes of video element enable control of video playback
- Video support for older browsers is added using object and param elements

- Fallback image can be provided
 - > For video tag, use the poster attribute
 - For object tag, nest an img tag before closing object tag
- Audio is added using the audio element
 - > Similar attributes to video element
- Use object and param elements to provide audio support for old browsers
